We can consider models of (S, \mathscr{S}) in $Mod_{M}(T, \mathscr{T})$.

The tensor product $(T, \mathscr{T}) \otimes_{\mathbb{S}} (S, \mathscr{S})$ is determined universally by the requirement that

• models of $(T, \mathscr{T}) \otimes_{\mathbb{S}} (S, \mathscr{S})$ in **M**

correspond naturally to

• models of (S, \mathscr{S}) in $Mod_{M}(T, \mathscr{T})$.

The tensor product is part of a symmetric monoidal structure on **Prop** (Hackney–Robertson). The monoidal unit is the single-sorted prop S of permutations.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

The tensor product is part of a symmetric monoidal structure on **Prop** (Hackney–Robertson). The monoidal unit is the single-sorted prop S of permutations.

Restricting this monoidal structure to

symmetric operads, we recover the *Boardman–Vogt* product;

The tensor product is part of a symmetric monoidal structure on **Prop** (Hackney–Robertson). The monoidal unit is the single-sorted prop S of permutations.

Restricting this monoidal structure to

- *symmetric operads*, we recover the *Boardman–Vogt* product;
- cartesian props, we recover the "tensor product of algebraic theories".

- ロ ト - 4 回 ト - 4 □

There is a single-sorted prop Mon whose models are monoids^{*}. Models of its dual Mon^{co} are comonoids.

*Also a symmetric operad.

Let (X, \bullet_X) and (Y, \bullet_Y) be (nice^{*}) pointed topological spaces. *A standard choice is compactly generated Hausdorff

The smash product $(X, \bullet_X) \land (Y, \bullet_Y)$ is obtained from $X \times Y$ by quotienting the fibres of \bullet_X, \bullet_Y down to a point.

It is part of a symmetric monoidal closed structure on $\mathbf{cgHaus}_{\bullet}.$ The monoidal unit is the coproduct 1+1 pointed with one of the coproduct inclusions.

 $X \wedge S^1$ is the reduced suspension ΣX for each pointed space X.

Why on earth should these two be related?

Beyond props (symmetric monoidal theories), we may consider

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Beyond props (symmetric monoidal theories), we may consider

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- pros ("planar" monoidal theories), and
- **probs** (braided monoidal theories).

Beyond props (symmetric monoidal theories), we may consider
pros ("planar" monoidal theories), and
probs (braided monoidal theories).

There is

- an embedding $\mathbf{Prop} \hookrightarrow \mathbf{Prob}$, and
- a forgetful functor U: $\mathbf{Prob} \rightarrow \mathbf{Pro}$,

with left adjoints r: $\mathbf{Prob} \rightarrow \mathbf{Prop}$ and F: $\mathbf{Pro} \rightarrow \mathbf{Prob}$.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

The theories of monoids and comonoids are naturally planar:

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

The theories of monoids and comonoids are naturally planar:

But their tensor product is not: in the theory of bialgebras,

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

(No "internal" tensor product on **Pro**!)
A mystery about symmetry

Baez–Dolan "periodic table of *n*-categories":

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

monoidal category

Baez–Dolan "periodic table of *n*-categories":

monoidal category ~
 (loop space of a) bicategory with one 0-cell

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Baez–Dolan "periodic table of *n*-categories":

 monoidal category \sim (loop space of a) bicategory with one 0-cell

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

braided monoidal category

Baez–Dolan "periodic table of *n*-categories":

 \blacksquare monoidal category \sim

(loop space of a) bicategory with one 0-cell

braided monoidal category ~

 (2-fold loop space of a) tricategory with one 0-cell, no non-degenerate 1-cells

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Baez–Dolan "periodic table of *n*-categories":

• monoidal category \sim

(loop space of a) bicategory with one 0-cell

braided monoidal category ~

 (2-fold loop space of a) tricategory with one 0-cell, no non-degenerate 1-cells

The "sliding surfaces" picture produces equations of diagrams in a tricategory (4d objects) from

diagrams in a pair of bicategories (2d objects).

- ロ ト - 4 回 ト - 4 □

There is an *external* tensor product $- \otimes -$: **Pro** \times **Pro** \rightarrow **Prob**

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

There is an *external* tensor product $- \otimes -: \mathbf{Pro} \times \mathbf{Pro} \to \mathbf{Prob}$

We recover the tensor product of props from the external product of their underlying pros, by imposing that a natural family of inclusions of the factors into their product preserve braidings.

A stricter periodic table:

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

A stricter periodic table:

■ pro ~→ 2-category with one 0-cell;

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

A stricter periodic table:

- pro ~→ 2-category with one 0-cell;
- prob ~~ Gray-category with one 0-cell, no non-degenerate 1-cells.

A stricter periodic table:

- pro ~→ 2-category with one 0-cell;
- prob ~→ Gray-category with one 0-cell, no non-degenerate 1-cells.

These objects are naturally *pointed* with their unique 0-cell.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

A stricter periodic table:

- pro ~→ 2-category with one 0-cell;
- prob ~→ Gray-category with one 0-cell, no non-degenerate 1-cells.

These objects are naturally *pointed* with their unique 0-cell.

If higher categories are "spaces of directed cells", we may see

- a pro as the loop space of a pointed directed 2-type,
- a prob as the 2-fold loop space of a pointed directed 3-type.

(A. Burroni) A freely generated strict ω -category (polygraph, aka computad) is a "formal CW complex" in ω **Cat**:

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

(A. Burroni) A freely generated strict ω -category (polygraph, aka computad) is a "formal CW complex" in ω **Cat**:

• the topological *n*-ball D^n is modelled by the *n*-globe O^n ,

(A. Burroni) A freely generated strict ω -category (polygraph, aka computad) is a "formal CW complex" in ω **Cat**:

- the topological *n*-ball D^n is modelled by the *n*-globe O^n ,
- gluing maps are modelled by arbitrary functors from ∂O^n .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

(A. Burroni) A freely generated strict ω -category (polygraph, aka computad) is a "formal CW complex" in ω **Cat**:

- the topological *n*-ball D^n is modelled by the *n*-globe O^n ,
- gluing maps are modelled by arbitrary functors from ∂O^n .

In the directed space picture, the set of sorts should become

- a 1-dimensional cell complex structure for pros,
- a 2-dimensional cell complex structure for probs.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Recapping the chain of analogies:

Recapping the chain of analogies:

a monoidal theory is like (the loop space of) a pointed directed space which is a 2-type and is equipped with a 1-dimensional cell complex structure on a subspace;

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Recapping the chain of analogies:

a **monoidal theory** is like (the loop space of) a pointed directed space which is a **2-type** and is equipped with a **1-dimensional cell complex** structure on a subspace;

a braided monoidal theory is like (the 2-fold loop space) of a pointed directed space which is a 3-type and is equipped with a 2-dimensional cell complex structure on a subspace.

- ロ ト - 4 回 ト - 4 □

Recapping the chain of analogies:

a monoidal theory is like (the loop space of) a pointed directed space which is a 2-type and is equipped with a 1-dimensional cell complex structure on a subspace; a braided monoidal theory is like (the 2-fold loop space) of a pointed directed space which is a 3-type

and is equipped with a 2-dimensional cell complex structure on a subspace.

The connection with smash products seems more plausible...

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

To make the connection precise we want:

1 A category of directed spaces,

- 1 A category of directed spaces,
- 2 with a monoidal structure inducing a smash product on the category of pointed directed spaces,

- A category of directed spaces,
- 2 with a monoidal structure inducing a smash product on the category of pointed directed spaces,
- 3 into which the categories of pros and probs embed faithfully,

- A category of directed spaces,
- with a monoidal structure inducing a smash product on the category of pointed directed spaces,
- 3 into which the categories of pros and probs embed faithfully,

 in such a way that the external product of pros factors through the smash product;

- A category of directed spaces,
- with a monoidal structure inducing a smash product on the category of pointed directed spaces,
- 3 into which the categories of pros and probs embed faithfully,

- ロ ト - 4 回 ト - 4 □

- in such a way that the external product of pros factors through the smash product;
- **5** and a "direction-forgetting" functor to pointed spaces

- A category of directed spaces,
- with a monoidal structure inducing a smash product on the category of pointed directed spaces,
- 3 into which the categories of pros and probs embed faithfully,

- in such a way that the external product of pros factors through the smash product;
- 5 and a "direction-forgetting" functor to pointed spaces
- 6 that sends smash products to smash products.

The category ω **Cat** with the (lax) Gray product has some of these features,

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The category ω **Cat** with the (lax) Gray product has some of these features, but

the "Gray smash product" of two monoidal categories (as pointed 2-categories) is not a braided monoidal category, but a highly degenerate *commutative* monoidal category;

The category ω **Cat** with the (lax) Gray product has some of these features, but

- the "Gray smash product" of two monoidal categories (as pointed 2-categories) is not a braided monoidal category, but a highly degenerate *commutative* monoidal category;
- there is no functor from ωCat to a category of spaces that works in the intended way.

We can associate to a cell complex its face poset...

and to a higher-categorical diagram its oriented face poset.

(日) (四) (日) (日) (日)

(After R. Steiner, The algebra of directed complexes, 1993)

An orientation on a finite poset P is an edge-labelling
 o : ℋP₁ → {+, -} of its Hasse diagram.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

(After R. Steiner, The algebra of directed complexes, 1993)

- An orientation on a finite poset P is an edge-labelling
 o : ℋP₁ → {+, -} of its Hasse diagram.
- An *oriented graded poset* is a finite graded poset with an orientation.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

(After R. Steiner, The algebra of directed complexes, 1993)

- An orientation on a finite poset P is an edge-labelling o: ℋP₁ → {+, -} of its Hasse diagram.
- An oriented graded poset is a finite graded poset with an orientation.
- If $U \subseteq P$ is (downward) closed, $\alpha \in \{+, -\}$, $n \in \mathbb{N}$,

 $\Delta_n^{\alpha} U \coloneqq \{x \in U \mid \dim(x) = n \text{ and if } y \in U \text{ covers } x, \text{ then } o(y \to x) = \alpha\},\$ $\partial_n^{\alpha} U \coloneqq \operatorname{cl}(\Delta_n^{\alpha} U) \cup \{x \in U \mid \text{for all } y \in U, \text{ if } x \leq y, \text{ then } \dim(y) \leq n\},\$ $\Delta_n U \coloneqq \Delta_n^+ U \cup \Delta_n^- U,\qquad \partial_n U \coloneqq \partial_n^+ U \cup \partial_n^- U.$

If U is a closed subset of P, then U is a *molecule* if either

- U has a greatest element, in which case we call it an *atom*, or
- there exist molecules U_1 and U_2 , both properly contained in U, and $n \in \mathbb{N}$ such that $U_1 \cap U_2 = \partial_n^+ U_1 = \partial_n^- U_2$ and $U = U_1 \cup U_2$.

If U is a closed subset of P, then U is a *molecule* if either

- U has a greatest element, in which case we call it an *atom*, or
- there exist molecules U_1 and U_2 , both properly contained in U, and $n \in \mathbb{N}$ such that $U_1 \cap U_2 = \partial_n^+ U_1 = \partial_n^- U_2$ and $U = U_1 \cup U_2$.

A molecule U has spherical boundary if, for all k < n,

$$\partial_k^+ U \cap \partial_k^- U = \partial_{k-1} U.$$

Regular directed complexes

▲□ > ▲圖 > ▲目 > ▲目 > ▲目 > ● ④ < ⊙

An oriented graded poset P is a *regular directed complex* if, for all $x \in P$ and $\alpha, \beta \in \{+, -\}$,

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- 1 $cl{x}$ has spherical boundary,
- **2** $\partial^{\alpha} x$ is a molecule, and

3
$$\partial^{\alpha}(\partial^{\beta}x) = \partial^{\alpha}_{n-2}x$$
 if $n := \dim(x) > 1$.

An oriented graded poset P is a *regular directed complex* if, for all $x \in P$ and $\alpha, \beta \in \{+, -\}$,

- 1 $cl{x}$ has spherical boundary,
- **2** $\partial^{\alpha} x$ is a molecule, and

3
$$\partial^{\alpha}(\partial^{\beta}x) = \partial^{\alpha}_{n-2}x$$
 if $n := \dim(x) > 1$.

A map $f: P \rightarrow Q$ of regular directed complexes is a function that satisfies

$$\partial_n^{\alpha} f(x) = f(\partial_n^{\alpha} x)$$

A D N A 目 N A E N A E N A B N A C N

for all $x \in P$, $n \in \mathbb{N}$, and $\alpha \in \{+, -\}$. Regular directed complexes and maps form a category **DCpx**^{\mathcal{R}}.

An oriented graded poset P is a *regular directed complex* if, for all $x \in P$ and $\alpha, \beta \in \{+, -\}$,

- 1 $cl{x}$ has spherical boundary,
- **2** $\partial^{\alpha} x$ is a molecule, and

3
$$\partial^{\alpha}(\partial^{\beta}x) = \partial^{\alpha}_{n-2}x$$
 if $n := \dim(x) > 1$.

A map $f: P \rightarrow Q$ of regular directed complexes is a function that satisfies

$$\partial_n^{\alpha} f(x) = f(\partial_n^{\alpha} x)$$

for all $x \in P$, $n \in \mathbb{N}$, and $\alpha \in \{+, -\}$. Regular directed complexes and maps form a category **DCpx**^{\mathcal{R}}.

A map factors essentially uniquely as a surjection followed by an inclusion.

Regular directed complexes

Proposition

The underlying poset of a regular directed complex is the face poset of a regular CW complex.

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Proposition

The underlying poset of a regular directed complex is the face poset of a regular CW complex.

(...and a regular CW complex structure is determined up to cellular homeomorphism by its face poset.)

Proposition

The underlying poset of a regular directed complex is the face poset of a regular CW complex.

(...and a regular CW complex structure is determined up to cellular homeomorphism by its face poset.)

In particular, the underlying poset of a regular n-dimensional atom is the face poset of a regular CW n-ball.

Idea: Given presentations X of (T, \mathscr{T}) and Y of (S, \mathscr{S}) , the smash product $X \otimes Y^{\circ}$ produces

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

Idea: Given presentations X of (T, \mathscr{T}) and Y of (S, \mathscr{S}) , the smash product $X \otimes Y^{\circ}$ produces

1 a presentation (with oriented equations) of $(T, \mathscr{T}) \otimes (S, \mathscr{S})$,

2 plus higher-dimensional coherence cells, or oriented syzygies, for this presentation.

Let X be a presentation of *Mon* with the 3-cells

・ロト ・ 国 ト ・ ヨ ト ・ ヨ ト

ж

Let X be a presentation of *Mon* with the 3-cells

・ロト ・ 国 ト ・ ヨ ト ・ ヨ ト

э

Then $X \otimes X$ is a presentation of $Mon \otimes Mon^{co}$.

Let X be a presentation of *Mon* with the 3-cells

Then $X \otimes X$ is a presentation of $Mon \otimes Mon^{co}$. It has the following "new" critical branching:

・ロト ・ 国 ト ・ ヨ ト ・ ヨ ト

э

The 5-cell $\alpha \otimes \mu$ in $X \otimes X$ exhibits confluence at this critical branching:

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

The 5-cell $\alpha \otimes \mu$ in $X \otimes X$ exhibits confluence at this critical branching:

The 5-cell $\alpha \otimes \mu$ in $X \otimes X$ exhibits confluence at this critical branching:

6-cells such as $\alpha \otimes \alpha$ are *higher syzygies* exhibiting confluence at critical branchings of syzygies

Question:

If we start from presentations with nice computational properties or nice homotopical properties,

do we obtain nice presentations of their tensor product?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Pros and probs are low-dimensional objects.

Pros and probs are low-dimensional objects.

Diagrammatic sets can be a (homotopically sound) context for presentations of higher-algebraic theories with oriented generators in arbitrary dimension.

Pros and probs are low-dimensional objects.

Diagrammatic sets can be a (homotopically sound) context for presentations of higher-algebraic theories with oriented generators in arbitrary dimension.

 k-tuply monoidal n-dimensional theories ~ k-fold directed loop spaces

(k = 1: monoidal, k = 2: braided monoidal)
