Diagrammatic sets: weak higher categories for rewriting

Amar Hadzihasanovic Formerly: RIMS, Kyoto University Currently: IRIF, Université de Paris

> TallCat Seminar 11 June 2020

arXiv:1909.07639

There is a paper. But I'm reworking it heavily. Read at your own risk.

The foundation of diagrammatic reasoning is a pasting theorem:

the statement that we can univocally interpret a certain class of diagrams in a certain model of higher categories.

There is a lack of pasting theorems for mainstream models of weak higher categories.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

 1987: Ross Street's The algebra of oriented simplexes is out, sparking an interest in the combinatorics of higher-dimensional categorical diagrams.

 1987: Ross Street's The algebra of oriented simplexes is out, sparking an interest in the combinatorics of higher-dimensional categorical diagrams.

Then several works on the combinatorics of *pasting diagrams* and their *pasting theorems* in strict *n*-categories:

- **1988**: John Power
- **1989**: Michael Johnson
- 1991: Ross Street, John Power
- 1993: Richard Steiner

Steiner's directed complexes

We can associate to a cell complex its face poset...

(日)、

э

We can associate to a cell complex its face poset...

and to a pasting diagram its oriented face poset.

Steiner 1993, *The algebra of directed complexes*, gives sufficient conditions for

- an oriented poset to be the oriented face poset of a pasting diagram, and
- the pasting diagram to be reconstructed from its oriented face poset.

Steiner 1993, *The algebra of directed complexes*, gives sufficient conditions for

- an oriented poset to be the oriented face poset of a pasting diagram, and
- the pasting diagram to be **reconstructed** from its oriented face poset.

Many oriented posets present ω -categories fewer present polygraphs, that is, ω -categories that are freely generated by some of their cells.

We can give it an orientation as in the *tensor product of chain complexes*.

We can give it an orientation as in the *tensor product of chain complexes*.

The product of two directed complexes is still a directed complex $P \boxtimes Q$, the lax Gray product of P and Q.

We can give it an orientation as in the *tensor product of chain complexes*.

The product of two directed complexes is still a directed complex $P \boxtimes Q$, the lax Gray product of P and Q.

If P has dim n and Q has dim k, $P \boxtimes Q$ has dim n + k.

We can give it an orientation as in the *tensor product of chain complexes*.

The product of two directed complexes is still a directed complex $P \boxtimes Q$, the lax Gray product of P and Q.

If P has dim n and Q has dim k, $P \boxtimes Q$ has dim n + k.

A variant of this was used to define the lax Gray product of ω -categories (Steiner 2004, Ara-Maltsiniotis 2017)

Lax Gray products and diagrammatic algebra

2d + 2d = 4d

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Around this time, I start seeing lax Gray products everywhere

Lax Gray products and diagrammatic algebra

2d + 2d = 4d

Around this time, I start seeing lax Gray products everywhere (I'm not the only one)

Example: Biunitary equations

Used by Jamie Vicary and Mike Stay to unify quantum and encrypted communication protocols. They are models of a lax Gray product of 2-categories.

Lax Gray products and diagrammatic algebra

Example: Distributive laws of monads

They are models in **Cat** of a lax Gray product of 2-categories.

monoidal category \rightsquigarrow 2-category with one 0-cell

・ロト・日本・モート モー うへぐ

monoidal category \rightsquigarrow 2-category with one 0-cell **PRO** \rightsquigarrow 2-cat with one 0-cell, one 1-generator

monoidal category \rightsquigarrow 2-category with one 0-cell **PRO** \rightsquigarrow 2-cat with one 0-cell, one 1-generator

These are naturally pointed objects in ω **Cat**. With pointed objects, it is natural to take smash products \wedge .

monoidal category \rightsquigarrow 2-category with one 0-cell **PRO** \rightsquigarrow 2-cat with one 0-cell, one 1-generator

These are naturally pointed objects in ω **Cat**. With pointed objects, it is natural to take smash products \wedge .

 $\textbf{PRO} \land \textbf{PRO} \rightsquigarrow$ 4-cat with one 0-cell, one 2-generator
The original example is not simply a lax Gray product.

monoidal category \rightsquigarrow 2-category with one 0-cell **PRO** \rightsquigarrow 2-cat with one 0-cell, one 1-generator

These are naturally pointed objects in ω **Cat**. With pointed objects, it is natural to take smash products \wedge .

 $\textbf{PRO} \land \textbf{PRO} \rightsquigarrow$ 4-cat with one 0-cell, one 2-generator

Morally this should be a braided monoidal category. But in strict ω -categories, it is a commutative monoidal category. This breaks everything.

Voevodsky's non-proof...

■ **1991**: Mikhail Kapranov and Vladimir Voevodsky publish ∞-groupoids and homotopy types, claiming a proof that strict higher categories model all homotopy types in the sense of the homotopy hypothesis.

Voevodsky's non-proof...

- **1991**: Mikhail Kapranov and Vladimir Voevodsky publish ∞-groupoids and homotopy types, claiming a proof that strict higher categories model all homotopy types in the sense of the homotopy hypothesis.
- **1998**: Carlos Simpson proves that the result is false (without pointing to a specific mistake).

- **1991**: Mikhail Kapranov and Vladimir Voevodsky publish ∞-groupoids and homotopy types, claiming a proof that strict higher categories model all homotopy types in the sense of the homotopy hypothesis.
- **1998**: Carlos Simpson proves that the result is false (without pointing to a specific mistake).

The core of the argument relies on the fact that "doubly monoidal" degenerates to "commutative" in strict 3-categories (strict Eckmann-Hilton).

Good takeaway #1 from Kapranov-Voevodsky:

homotopy types may have **semi**strict algebraic models with weak units

2006: André Joyal and Joachim Kock in dim 3

Good takeaway #1 from Kapranov-Voevodsky:

homotopy types may have **semi**strict algebraic models with weak units

- **2006**: André Joyal and Joachim Kock in dim 3
- 2017: Simon Henry and I come up independently with the regularity constraint as a way of avoiding the pitfall of strict Eckmann-Hilton

Good takeaway #1 from Kapranov-Voevodsky:

Diagrammatic sets

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

...and more good ideas

Good takeaway #2 from Kapranov-Voevodsky:

Diagrammatic sets

Kapranov-Voevodsky pass from spaces to ω -categories through an intermediate notion of "spaces locally modelled on combinatorial pasting diagrams",

they call diagrammatic sets.

 2019: Kapranov-Voevodsky's equivalence of "Kan diagrammatic sets" and spaces is "morally correct"

...except they chose the wrong class of combinatorial diagrams, not closed under most of the operations they perform.

 2019: Kapranov-Voevodsky's equivalence of "Kan diagrammatic sets" and spaces is "morally correct"

...except they chose the wrong class of combinatorial diagrams, not closed under most of the operations they perform.

Directed complexes + all cells have spherical boundary works!

 2019: Kapranov-Voevodsky's equivalence of "Kan diagrammatic sets" and spaces is "morally correct"

...except they chose the wrong class of combinatorial diagrams, not closed under most of the operations they perform.

Directed complexes + all cells have spherical boundary works!

(Work in progress: axiomatic approach relative to "nice classes of diagrams")

 There is a natural coinductive definition of equivalence cell in a diagrammatic set.

- There is a natural coinductive definition of equivalence cell in a diagrammatic set.
- A diagrammatic set where every diagram with spherical boundary is equivalent to a single cell
 — its "weak composite" —
 is a reasonable notion of weak ω-category.

- There is a natural coinductive definition of equivalence cell in a diagrammatic set.
- A diagrammatic set where every diagram with spherical boundary is equivalent to a single cell
 — its "weak composite" —
 is a reasonable notion of weak ω-category.

This is a model where we can interpret *every regular diagram* and compose *every diagram with spherical boundary*.

This is a model where we can interpret *every regular diagram* and compose *every diagram with spherical boundary*.

Just "stuff" any diagram with units and it will become regular!

 1993: Albert Burroni's Higher-dimensional word problems suggests the theory of polygraphs as an arena to "unify all rewriting theories"

This started a slowly rising French school of rewriting with polygraphs (Yves Lafont, Philippe Malbos, Yves Guiraud, Samuel Mimram...)

and related work on ω -categories (François Métayer, Georges Maltsiniotis, Dimitri Ara...)

which is why I am in Paris now

Many of the core ideas in polygraphic rewriting rest on an analogy between

polygraphs and CW complexes, "presented ω -categories" and "presented spaces".

Many of the core ideas in polygraphic rewriting rest on an analogy between

polygraphs and CW complexes, "presented ω -categories" and "presented spaces".

This analogy is limited by the fact that strict ω -categories do not model all spaces.

Everything that can be done with polygraphs can be done equally or better with diagrammatic sets.

Everything that can be done with polygraphs can be done equally or better with diagrammatic sets.

Key rewriting operations like substitution, gluing are done combinatorially, not with inductions on algebraic syntax
