Additive Combinatorics and Discrete Logarithm Based Range Protocols

Rafik Chaabouni, Helger Lipmaa, Abhi Shelat

EPFL, Cybernetica AS, University of Virginia

October 3, 2009

Chaabouni, Lipmaa, Shelat Additive Combinatorics and DL-Based Range Protocols

Outline I

Motivation

- Zero-Knowledge Proofs
- Additive Combinatorics

Zero-Knowledge Proofs Additive Combinatorics

Zero-Knowledge Proofs

 Full security of cryptographic protocols is achieved usually by having a zero-knowledge proof (of knowledge)

Zero-Knowledge Proofs Additive Combinatorics

Zero-Knowledge Proofs

- Full security of cryptographic protocols is achieved usually by having a zero-knowledge proof (of knowledge)
- Zero-knowledge: does not leak any extra information

Zero-Knowledge Proofs

- Full security of cryptographic protocols is achieved usually by having a zero-knowledge proof (of knowledge)
- Zero-knowledge: does not leak any extra information
- Proof: the actions of any party are consistent with his committed input Com(x)

< 同 > < ∃ >

Zero-Knowledge Proofs

- Full security of cryptographic protocols is achieved usually by having a zero-knowledge proof (of knowledge)
- Zero-knowledge: does not leak any extra information
- Proof: the actions of any party are consistent with his committed input Com(x)
- We actually are interested in Σ-protocols (see the paper)

Zero-Knowledge Proofs Additive Combinatorics

Range Proofs

 It is often sufficient to ZK-prove that committed input belongs to a correct set, e.g., is Boolean

A (1) > A (2) > A

Range Proofs

- It is often sufficient to ZK-prove that committed input belongs to a correct set, e.g., is Boolean
- Example: we are currently implementing an e-voting protocol where for correctness, it is necessary to prove that x ∈ [0, H]

Range Proofs

- It is often sufficient to ZK-prove that committed input belongs to a correct set, e.g., is Boolean
- Example: we are currently implementing an e-voting protocol where for correctness, it is necessary to prove that x ∈ [0, H]
 - Without such a ZK proof, the voter could induce "buffer overflow"-type errors

Range Proofs

- It is often sufficient to ZK-prove that committed input belongs to a correct set, e.g., is Boolean
- Example: we are currently implementing an e-voting protocol where for correctness, it is necessary to prove that x ∈ [0, H]
 - Without such a ZK proof, the voter could induce "buffer overflow"-type errors

 To construct efficient ZK proofs, one needs to assume that *Com* satisfies nice algebraic properties

- To construct efficient ZK proofs, one needs to assume that *Com* satisfies nice algebraic properties
- Homomorphic commitment:
 Com(x)Com(x') = Com(x + x')

- To construct efficient ZK proofs, one needs to assume that *Com* satisfies nice algebraic properties
- Homomorphic commitment:
 Com(x)Com(x') = Com(x + x')
- From this trivially, $\prod Com(x_i)^{a_i} = Com(\sum a_i x_i)$

- To construct efficient ZK proofs, one needs to assume that *Com* satisfies nice algebraic properties
- Homomorphic commitment:
 Com(x)Com(x') = Com(x + x')
- From this trivially, $\prod Com(x_i)^{a_i} = Com(\sum a_i x_i)$
- Example: to prove that $x \in [0, 2^{\ell} 1]$, commit to bits x_i , then ZK-prove that $x_i \in [0, 1]$, then compute $Com(x) = \prod Com(x_i)^{2^i} = Com(\sum x_i 2^i)$

Motivation Zero-Knowledge Proofs
Our Results Additive Combinatorics

Additive Combinatorics

 Define A + B := {a + b : a ∈ A ∧ b ∈ B} and b * A = {ba : a ∈ A}

Chaabouni, Lipmaa, Shelat Additive Combinatorics and DL-Based Range Protocols

A (10) A (10) A (10)

 Motivation
 Zero-Knowledge Proofs

 Our Results
 Additive Combinatorics

Additive Combinatorics

- Define A + B := {a + b : a ∈ A ∧ b ∈ B} and b * A = {ba : a ∈ A}
- A + B is sumset, b * A is b-dilate of A

A (1) > A (2) > A

Motivation Zero-Knowledge Proofs
Our Results Additive Combinatorics

Additive Combinatorics

- Define A + B := {a + b : a ∈ A ∧ b ∈ B} and b * A = {ba : a ∈ A}
- A + B is sumset, b * A is b-dilate of A
- Additive combinatorics is the sexy subject that studies the properties of sumsets

Additive Combinatorics

- Define A + B := {a + b : a ∈ A ∧ b ∈ B} and b * A = {ba : a ∈ A}
- A + B is sumset, b * A is b-dilate of A
- Additive combinatorics is the sexy subject that studies the properties of sumsets
- Nobel price winners Terry Tao, Tim Gowers work on additive combinatorics, and recently Luca Trevisan and others have tried to apply additive combinatorics in theoretical computer science

Range Proofs: Previous Work

- Camenisch, Chaabouni, Shelat 2008:
 - Write $[0, u^{\ell} 1] = \sum u^{i} * [0, u 1]$
 - ZK proof that x_i ∈ [0, u − 1] done by letting verifier to sign values 0, ..., u − 1, and the prover to prove that he knows signatures on all values x_i
 - Uses specific signatures schemes based on bilinear pairings
 - By selecting optimal *u*, the communication complexity is ⊖(log *H*/ log log *H*)
- To prove that $x \in [0, H]$, prove that $x \in [0, u^{\ell} - 1] \land x \in [H - (u^{\ell} - 1), H]$ for $H \le u^{\ell} - 1 < 2H$ — twice less efficient

Range Proofs: Previous Work

- Camenisch, Chaabouni, Shelat 2008:
 - Write $[0, u^{\ell} 1] = \sum u^{i} * [0, u 1]$

Problem that We Solve

Question 1: can we write

 [0, H] = ∑_{i=0}^{ℓ-1} G_i * [0, u - 1] with some G_i and small ℓ

Problem that We Solve

- Question 1: can we write

 [0, H] = ∑_{i=0}^{ℓ-1} G_i * [0, u 1] with some G_i and small ℓ
- Question 2: If so, compute G_i

Problem that We Solve

- Question 1: can we write

 [0, H] = ∑_{i=0}^{ℓ-1} G_i * [0, u 1] with some G_i and small ℓ
- Question 2: If so, compute G_i
- Answer 1: we can write

 [0, H] = ∑ G_i * [0, 1] + [0, H']
 ℓ < log_u(H + 1) and H' < u 1

New Sumset-Representation

Problem that We Solve

- Question 1: can we write

 [0, H] = ∑_{i=0}^{ℓ-1} G_i * [0, u 1] with some G_i and small ℓ
- Question 2: If so, compute G_i
- Answer 1: we can write

 [0, H] = ∑ G_i * [0, 1] + [0, H']
 ℓ ≤ log_u(H + 1) and H' < u 1
 If (u 1) | H then H' = 0
- Answer 2: we give a semi-closed form for G_i

Basic Idea

Write [0, *H*₀] = *G*₀ ∗ [0, *u* − 1] + [0, *H*₁] such that *H*₁ is minimal

Chaabouni, Lipmaa, Shelat Additive Combinatorics and DL-Based Range Protocols

A (10) A (10) A (10)

Basic Idea

- Write [0, *H*₀] = *G*₀ ∗ [0, *u* − 1] + [0, *H*₁] such that *H*₁ is minimal
- Equiv.: Cover [0, H₀] with u intervals of size H₁ that start at periodic positions iG₀

Basic Idea

- Write [0, *H*₀] = *G*₀ ∗ [0, *u* − 1] + [0, *H*₁] such that *H*₁ is minimal
- Equiv.: Cover [0, H₀] with u intervals of size
 H₁ that start at periodic positions iG₀

[0, 17] = 6 * [0, 2] + [0, 5] = 4 * [0, 3] + [0, 5] =3 * [0, 4] + [0, 5]

Chaabouni, Lipmaa, Shelat Additive Combinatorics and DL-Based Range Protocols

Basic Idea

 Cover [0, H₀] with u intervals of minimal size H₁ that start at periodic positions iG₀

Basic Idea

- Cover [0, H₀] with u intervals of minimal size H₁ that start at periodic positions iG₀
- Trivially, $H_1 \ge G_0 1$ and $(u 1)G_0 + H_1 = H_0$

Chaabouni, Lipmaa, Shelat Additive Combinatorics and DL-Based Range Protocols

(日)

Basic Idea

 Cover [0, H₀] with u intervals of minimal size H₁ that start at periodic positions iG₀

Basic Idea

Cover [0, H₀] with u intervals of minimal size H₁ that start at periodic positions iG₀
Trivially, H₁ ≥ G₀ − 1 and (u − 1)G₀ + H₁ = H₀

A (10) A (10) A (10)

Basic Idea

- Cover [0, H₀] with u intervals of minimal size H₁ that start at periodic positions iG₀
- Trivially, $H_1 \ge G_0 1$ and $(u 1)G_0 + H_1 = H_0$
- We need minimal H_1 so set $H_1 := G_0 1$

Basic Idea

- Cover [0, H₀] with u intervals of minimal size H₁ that start at periodic positions iG₀
- Trivially, $H_1 \ge G_0 1$ and $(u 1)G_0 + H_1 = H_0$
- We need minimal H_1 so set $H_1 := G_0 1$
- Thus

 $(u-1)G_0+G_0-1=H_0\Longrightarrow G_0=(H_0+1)/u$

(日)

Basic Idea

- Cover [0, H₀] with u intervals of minimal size H₁ that start at periodic positions iG₀
- Trivially, $H_1 \ge G_0 1$ and $(u 1)G_0 + H_1 = H_0$
- We need minimal H_1 so set $H_1 := G_0 1$
- Thus
 - $(u-1)G_0+G_0-1=H_0 \Longrightarrow G_0=(H_0+1)/u$
- Since G_0 is integer, set $G_0 := \lfloor (H_0 + 1)/u \rfloor$

Basic Idea

- Trivially, $H_1 \ge G_0 1$ and $(u 1)G_0 + H_1 = H_0$
- We need minimal H_1 so set $H_1 := G_0 1$
- Thus
 - $(u-1)G_0+G_0-1=H_0\Longrightarrow G_0=(H_0+1)/u$
- Since G_0 is integer, set $G_0 := \lfloor (H_0 + 1)/u \rfloor$
- Also set $H_1 := H_0 (u 1)G_0$

(日)

Basic Idea

- Cover [0, H₀] with u intervals of minimal size H₁ that start at periodic positions iG₀
- Trivially, $H_1 \ge G_0 1$ and $(u 1)G_0 + H_1 = H_0$
- We need minimal H_1 so set $H_1 := G_0 1$
- Thus
 - $(u-1)G_0+G_0-1=H_0\Longrightarrow G_0=(H_0+1)/u$
- Since G_0 is integer, set $G_0 := \lfloor (H_0 + 1)/u \rfloor$
- Also set $H_1 := H_0 (u 1)G_0$
- Optimal solution to
 [0, H₀] = G₀ * [0, u 1] + H₁

Basic Idea

• We got $[0, H_0] = G_0 * [0, u - 1] + [0, H_1]$ with $H_1 < H_0$

Chaabouni, Lipmaa, Shelat Additive Combinatorics and DL-Based Range Protocols

(日)

Basic Idea

- We got $[0, H_0] = G_0 * [0, u 1] + [0, H_1]$ with $H_1 < H_0$
- If *H*₁ ≥ *u* − 1, then continue recursively by setting

$$G_i := \lfloor (H_i + 1)/u \rfloor$$
$$H_{i+1} := H_i - (u-1)G_i$$

(日)

Basic Idea

- We got $[0, H_0] = G_0 * [0, u 1] + [0, H_1]$ with $H_1 < H_0$
- If *H*₁ ≥ *u* − 1, then continue recursively by setting

$$G_i := \lfloor (H_i + 1)/u \rfloor$$
$$H_{i+1} := H_i - (u-1)G_i$$

 It is easy to see that this process stops within ℓ ≤ log_u(H + 1) steps

Basic Idea

- We got $[0, H_0] = G_0 * [0, u 1] + [0, H_1]$ with $H_1 < H_0$
- If *H*₁ ≥ *u* − 1, then continue recursively by setting

$$G_i := \lfloor (H_i + 1)/u \rfloor$$
$$H_{i+1} := H_i - (u-1)G_i$$

- It is easy to see that this process stops within ℓ ≤ log_u(H + 1) steps
- Set $H' := H_{\ell} = H \lfloor H/(u-1) \rfloor \cdot (u-1)$

Theorem

Theorem

 $[0, H] = \sum_{i=0}^{\ell} G_i * [0, u - 1] + [0, H']$ with $\ell \leq \log_u(H + 1)$, G_i given by recursive formulas, and H' as in the last slide

Optimal case: $u \approx \log_2 H / \log_2 \log_2 H$, then the range proof has length $\Theta(\log H / \log H \log H)$

Semi-Closed Form for G_i

Theorem

A (10) + A (10) +

Semi-Closed Form for G_i

Theorem

See the paper. Proof by induction, requires some case analysis.

A (1) > A (2) > A

Semi-Closed Form for G_i

Theorem

Let
$$H = \sum h_i 2^i$$
. Then
 $G_i = \lfloor \frac{H}{u^{i+1}} \rfloor + \lfloor \frac{h_i + 1 + (\sum_{j=0}^{i-1} h_j \mod u - 1)}{u} \rfloor$

See the paper. Proof by induction, requires some case analysis. [LAN02] result follows: there u = 2, thus anything $\equiv 0 \mod u - 1$

A (1) > A (2) > A

More Details

• ZK-proof follows [CCS08], but uses the new sumset-representation of [0, *H*]

More Details

- ZK-proof follows [CCS08], but uses the new sumset-representation of [0, *H*]
- Additional optimization:

More Details

- ZK-proof follows [CCS08], but uses the new sumset-representation of [0, *H*]
- Additional optimization:
 - Recall that if (u 1) | H then H' = 0

< 同 > < 回 > < 回
More Details

- ZK-proof follows [CCS08], but uses the new sumset-representation of [0, *H*]
- Additional optimization:
 - Recall that if (u 1) | H then H' = 0
 - Instead of *x* ∈ [0, *H*] we prove that (*u* − 1)*x* ∈ [0, (*u* − 1)*H*]

▲ 同 ▶ → 三 ▶

More Details

- ZK-proof follows [CCS08], but uses the new sumset-representation of [0, *H*]
- Additional optimization:
 - Recall that if (u 1) | H then H' = 0
 - Instead of x ∈ [0, H] we prove that (u − 1)x ∈ [0, (u − 1)H]
- Range proof twice more efficient than [CCS08] for general H

Questions?

 Our contribution: cryptographic problem solved by reformulating a problem in the language of additive combinatorics, but solving it by a new (independent) technique

Questions?

- Our contribution: cryptographic problem solved by reformulating a problem in the language of additive combinatorics, but solving it by a new (independent) technique
- Question: Can you use existing techniques from AC?

Questions?

- Our contribution: cryptographic problem solved by reformulating a problem in the language of additive combinatorics, but solving it by a new (independent) technique
- Question: Can you use existing techniques from AC?
- Open question: devise an "efficient" sumset-representation for a large family of sets A
